I am a model theorist working on various problems at the nexus of logic, algebra, geometry and number theory. My main interest is to recover concrete mathematical structure from given logical data, such as Lie groups from definable groups, algebraic curves from definable sets with many rational points, algebraically closed fields from strongly minimal structures, and algebraic topology (homotopy/homology) from semi-linear data. I am also interested in applications of model theory to computer science and machine learning.
